NovaGenGliko

Increasing the Development of New Products and Services Arising from Research and Development Activities

Through the New Generation of High-Throughput GlycoServices (NovaGenGliko) project, GENOS will expand the range of its services, which is crucial for further development and market expansion. The ability to quickly adapt to client requirements, a broad spectrum of automated high-throughput analyses supported by new analytical methods, and the capability to analyze various biological samples will collectively contribute to market growth. Most importantly, this will enable GENOS to maintain a high market share.

High-throughput services will contribute to the optimization of glycoanalysis and significantly reduce the cost of individual analyses.

In addition to new technological services, the project brings a significant expansion of GENOS's production capacities, which will support the development of the next generation of drugs and biomarkers. At the same time, it will open the doors for the advancement of personalized analysis concepts.
